

# Printing from CaseMap

Printing from CaseMap is substantially similar to printing from most other pieces of software. The first step is to open the CaseMap file you wish to print. Your LP professor will probably ask you to submit printed reports from CaseMap, so you need to know how to prepare them.

1. Once you have the file open, choose Print from the File menu.

2. Once you select Print, you will see a new window. By default, CaseMap will print in a landscape format so that all your text will fit across the page. This means that you do not have to adjust margins in your document, because CaseMap will automatically adjust text to fit across the width of the page. Choosing OK will print your document.

3. Printing in CaseMap will only print the screen currently displayed, so if you wish to print the Issues screen, you must be looking at the Issues screen when you choose Print from the File menu.
