Complete Streets are designed and operated to enable safe access for all users. Pedestrians, bicyclists, motorists and bus riders of all ages and abilities are able to safely move along and across a complete street.

**Complete Streets**

**INTRODUCTION**

The desire for safe streets that function well for all users is a timeless idea. Since the early part of the last century, street design has been an interdisciplinary affair, often occurring in the context of a larger vision for the neighborhood, community, or city. Designs were guided by the uses planned along the street, the needs of pedestrians, horse drawn carriages, bicycles, and even streetcars. In urban environments, conflicts between these street users were commonplace and various design solutions were devised to address these challenges.

With the mid-20th century rise of the automobile, however, the focus on street design shifted; driven by new physical and safety considerations related to the size, weight, and speed of the automobile. Specialists in traffic engineering emerged. A new professional language was created. Roadway standards were developed, and attention was increasingly focused on moving vehicles quickly, minimizing delay for motorists, and increasing the personal freedom, access, and mobility afforded by the automobile.

Today, there is a growing public desire for a return to more walkable and bikeable streets that support livable communities. Increasingly, local and regional agencies are working in support of street and transportation network design that encourages walking, bicycling, transit use by all users, including children, seniors, and disabled.

A complete street is safe, comfortable, and convenient for travel via automobile, foot, bicycle, and transit. This concept was initially championed by cycling advocacy groups seeking increased accommodation of cyclist needs in roadway design. Their initial research revealed a changing attitude among the majority of Americans. For the first time in decades, surveys are showing a preference for expanding existing public transportation and building new bikeways and sidewalks over expanding existing highways and building new highways.¹

IMPLICATIONS OF NOT ADDRESSING THE ISSUE

The sustainability implications of a narrow focus on the automobile are widespread. At the community scale, land uses have become increasingly segregated and separated by larger distances, requiring more time and more energy to meet daily needs. At the neighborhood scale, higher traffic speeds and higher traffic volumes increasingly conflict with pedestrian and bicycle uses that once shared the same streets. At the roadway intersection level, improvements constructed to meet vehicular delay standards have the unintended consequence of also creating wide and unfriendly barriers to pedestrian crossing.

Incomplete street design may also result in continued safety problems. Streets designed exclusively for the automobile have been associated with disproportionately high crash rates and fatalities for pedestrians and bicyclists. While pedestrian and bicycle trips account for roughly 9% of all trips, 13% of all traffic related fatalities involve pedestrians and bicyclists. Additionally, with the growing desire for walking and bicycling, the potential for more crashes and injury may increase if streets are not designed to serve all users.

GOALS

- Increased safety for the most vulnerable street users, especially bicyclists and pedestrians
- Increased choices for mobility
- Increased access for non-driving population
- Energy savings related to more fuel efficient modes of travel
- Reduced vehicle miles traveled (VMT) resulting in:
  - CO2 emission reduction
  - Improved traffic flow
  - Decreased maintenance and repair costs
- Increased physical activity levels resulting in improved public health
- Improved design standards and guidelines

**Potential Sustainability Measures**

Potential sustainability measures for Complete Streets relate to the community design, the transportation network, and the choices available to the traveling public. The most sustainable Complete Streets communities will have a diverse mix of land uses that are accessible by many modes of travel on streets that serve all users safely and comfortably, and the resulting share of walking, bicycling, and transit trips are expected to be higher than comparable communities.

- Percent of streets with accommodation for all modes
- Quality or Level of Service for all modes
- Percent of population within walking distance of transit
- Percent of jobs within walking distance of transit
- Percent of population served by bicycle facilities
- Percent of jobs served by bicycle facilities
- Average vehicle trip length (shorter is better)
- Bicycling mode share
- Walking mode share
- Transit mode share
- Energy (fuel) savings related to mode share (relative to national or regional averages)
- Safer streets (reduction in bicycle & pedestrian crash severity and frequency)
- Emissions metrics related to vehicle use

COMPLETE STREETS

KEY STATISTICS AND FACTS:
- For the first time in decades, surveys are showing a preference for expanding existing public transportation and building new bikeways and sidewalks over expanding existing highways and building new highways.\(^1\)
- There are an estimated 35.3 billion walking trips nationwide every year in the U.S.\(^2\)
- Walking is not just for recreation. Over 50% of all walking trips serve a functional purpose other than exercise and recreation\(^3\)
- Nearly a third of Americans do not drive, and the non-driving senior population will grow even larger in the near future with the aging Boomer generation
- 55% of Americans say they would rather drive less and walk more\(^4\)
- The top pedestrian complaint is simply that there are too few sidewalks\(^5\)
- The top bicyclist complaint is simply that there are too few bikeways\(^6\)
- While pedestrian and bicycle trips account for roughly 9% of all trips, 13% of all traffic related fatalities involve pedestrians and bicyclists\(^7\)

| Remove Obstacles | • Modal Accommodation - all modes of travel routinely accommodated on all local, collector, and arterial streets
  • Vehicular Level of Service (LOS) – allow exceptions from jurisdiction standards on case by case basis
  • Design Speed – allow design speed to match posted and planned operating speed on case by case basis
  • Roadway Design – allow exception from standard cross sections based on context and consideration of other transportation goals on case by case basis
  • Travel Lane Widths – allow exception from standard vehicle lane width (typ. 12') on a case by case basis
  • Design Vehicle – allow exceptions to the standard design vehicle (e.g WB 50 truck) on a case by case basis | Modal Accommodation - all modes of travel required to be accommodated on all local, collector, and arterial streets in specific districts or areas (CBD, urban centers, TODs)
  • Vehicular Level of Service (LOS) – flexible level of service policy that allows for consideration of other transportation goals – applied in specific districts or areas (CBD, urban centers, TODs)
  • Design Speed – design speed allowed to match posted and planned operating speed allowed to match posted and planned operating speed – applied throughout the jurisdiction
  • Roadway Design – multiple roadway design options or cross sections for various roadway types based on land use context and modal function (sometimes referred to as "Street Typologies")
  • Travel Lane Widths – flexible lane width options based on land use context and modal function (e.g., allowance of 10' vehicle travel lanes) throughout the jurisdiction | Completestreets.org is a comprehensive online resource.
  • Context Sensitive Solutions in Designing Major Urban Thoroughfares for Walkable Communities, ITE Proposed Recommended Practice is a comprehensive guide to street design that reflects a joint effort between ITE and the Congress for New Urbanism. Available online. Retrieved November 2, 2010.
